There are things in life with a price to pay
But we can keep it simple if we estimate
That's where rounding is good to use
So let's learn the steps on what to do

Round round round round rounding

Underline the digit in the place value
That you're being asked to round to
Then draw an arrow from the digit that's
underlined
To the nearest digit on the right side
Once you draw the arrow here's what you do...
Look at the digit the arrow's pointing to

And if its five or more, let it soar
Four or less, let it rest
Five or more, let it soar
Four or less, let it rest
All the digits to the right to the right turn to zero
And if there are digits to the left to the left
They stay the same and then you know

If its five or more, let it soar
Four or less, let it rest
If its five or more, let it soar
Four or less, let it rest

****RAP****

Check it out, check it out
Now the rules of the game are gonna change
Cause the numbers on the left don't always stay
the same
For example...
If the number underlined is nine
It's gonna break the R U L E every time
And that's fine
Cause the digits to the left go up by one
While the digits to the right go to zero or none
Now this is the exception to the rule
With any other number then you know it's all cool

Singing...

If its five or more, let it soar
Four or less, let it rest
And if its five or more, let it soar
Four or less, let it rest

All the digits to the right to the right turn to zero
And if there are digits to the left to the left
They stay the same and then you know
If its five or more, let it soar
Four or less, let it rest
Round round round round rounding
